

Estimation of e-cigarette aerosol yields based on puff duration

Nicole Tschierske, Rémi Julien, Bénédicte Varignon, Valérie Troude,
Sandrine Destruhaut, Tanvir Walele, Stéphane Colard, [Xavier Cahours](#)

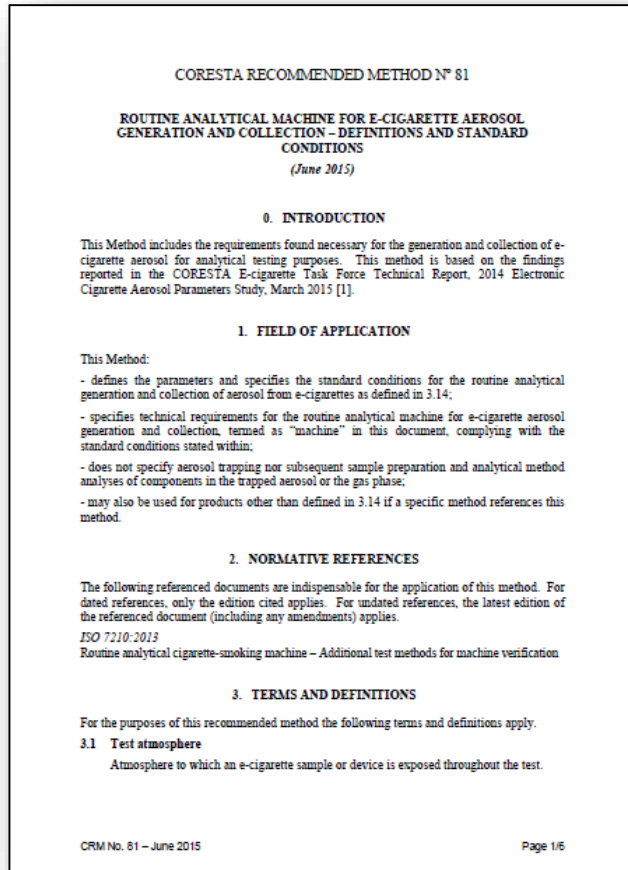

There is increasing regulatory interest in the quantification and comparison of emission levels of major and minor aerosol constituents from e-cigarettes.

A variety of puffing regimes have been described in the literature.

However, until the recent publication in 2015 of CRM 81¹, no international standard was or still is in place to describe how these products should be tested

¹ CRM 81 (2015) Routine Analytical Machine for e-Cigarette Aerosol Generation and Collection – Definitions and Standard Conditions

CORESTA RECOMMENDED METHOD 81

Puff Duration	Puff Volume	Puff Frequency	Puff Profile
3 s \pm 0.1 s	55 mL \pm 0,3 mL	30 s \pm 0.5 s	Rectangular

This method is based on the findings reported in the CORESTA E-cigarette Task Force Technical Report, 2014 Electronic Cigarette Aerosol Parameters Study, March 2015.

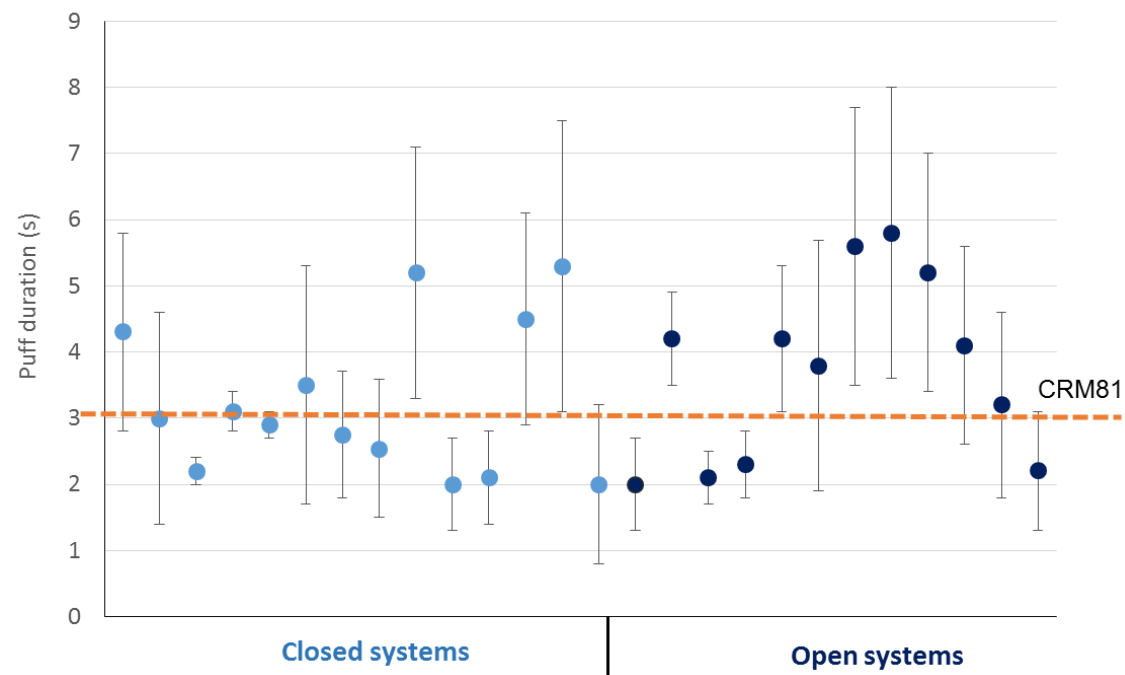

In May 2016, the U.S Food and Drug Administration published **draft** guidance for Industry entitled 'Premarket Tobacco Product Applications for Electronic Nicotine Delivery Systems'. Lines 1021 – 1024 of the guidance states:

*“Evaluating new tobacco products under a range of conditions, including both **non-intense** (e.g., lower levels of exposure and lower volumes of aerosol generated) and **intense** (e.g., higher levels of exposure and higher volumes of aerosol generated), enables FDA to understand the likely range of delivery of emissions”*

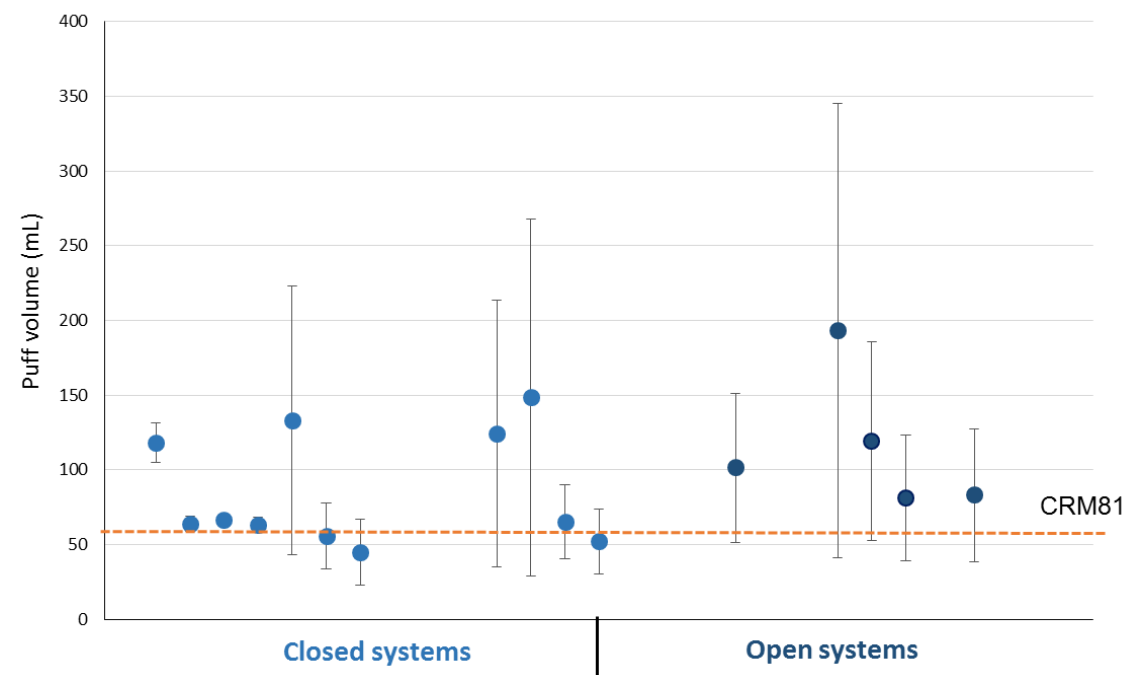

▼ Why asking for two vaping regimes?

Human vaping topography*

▼ Puff duration

▼ Puff volume

▼ Impact of vaping parameters on emission deliveries?

▼ *19 publications from 2013 to 2016

Please note that the views and arguments presented in this paper have been designed to encourage and stimulate debate and do not necessarily reflect Fontem Ventures' position

Vaping parameters

Puff Duration

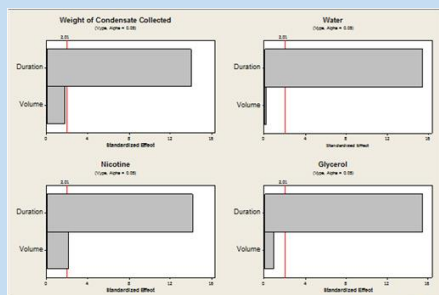

Most influential parameter!

average e-liquid consumption depending on puff duration

increasing puff duration
→ strong increase in liquid consumption
(Zhao, Shu, Guo, & Zhu, 2016)

Puff Volume

The Pareto charts show duration has a significant effect on the yields of major aerosol constituents, but puff volume does not.
(Davis et al., poster "Influence of machine-based puffing parameters on aerosol yields from e-cigarettes")

Flow Rate

average e-liquid consumption depending on flow rate

increasing flow rate → liquid consumption only increased slightly
(Zhao, Shu, Guo, & Zhu, 2016)

Puff Profile

Bell shaped puff profiles switch devices on later than square shaped profile (takes longer until minimum flow rate to activate puff sensor is reached). This leads to a delay in heating.
(internal study)

Puff Interval

Starting temperature increases with shorter interval, but no effect on peak temperature
(Zhao, Shu, Guo, & Zhu, 2016)

To evaluate the effect of vaping parameters on emission deliveries for bluTM e-cigarette products

Vaping regimes:

	Puff Duration [s]	Flow Rate [mL/s]	Puff Volume [mL]
1	2	13.75	27.5
2	3	18.33	55
3	4	13.75	55
4	6	13.75	82.5

- Aerosol was collected for the first 100 puffs in five blocks of 20 puffs (n = 3).
- All tests were performed using rectangular puff profile.
- Weight loss, ACM, PG, VG, Water and Nicotine were analysed using 17025 accredited methods.

Liquid composition:

	PG (w/w)	VG (w/w)	Nicotine (w/w)
Liquid 1 (L1):	68.8 %	30 %	1.2%
Liquid 2 (L2):	48.8 %	50 %	1.2%

Results – Statistics (ANOVA)

	Device	Liquid	Puff Duration	Puff Volume	Puff Block
Weight loss	NS	NS	S	NS	NS
ACM	NS	NS	S	NS	NS
Nicotine	NS	NS	S	NS	NS
PG	NS	S	S	NS	NS
VG	NS	S	S	NS	NS

$$S = P_{value} < 0.001$$

Weight loss versus puff duration

Stability among the puff blocks

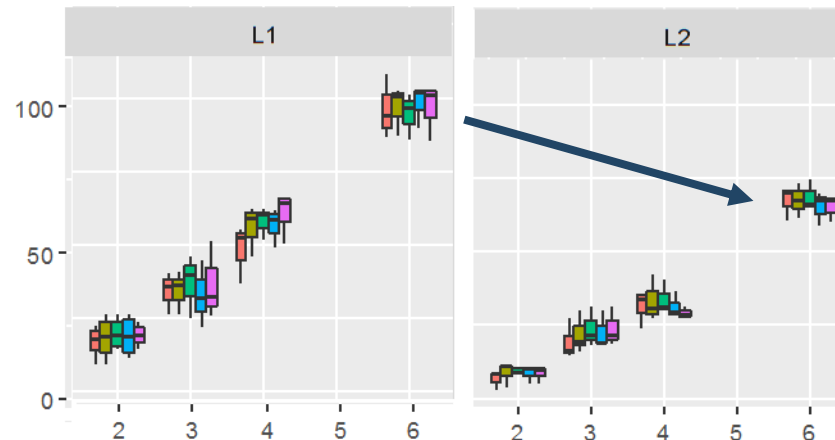

WL “comparable” between devices and liquids investigated, which indicates that both base liquid composition and device design had no significant impact on the aerosol delivery in this study

Nicotine – PG – VG vs puff duration vs e-liquids (PRO)

Nicotine

PG

VG

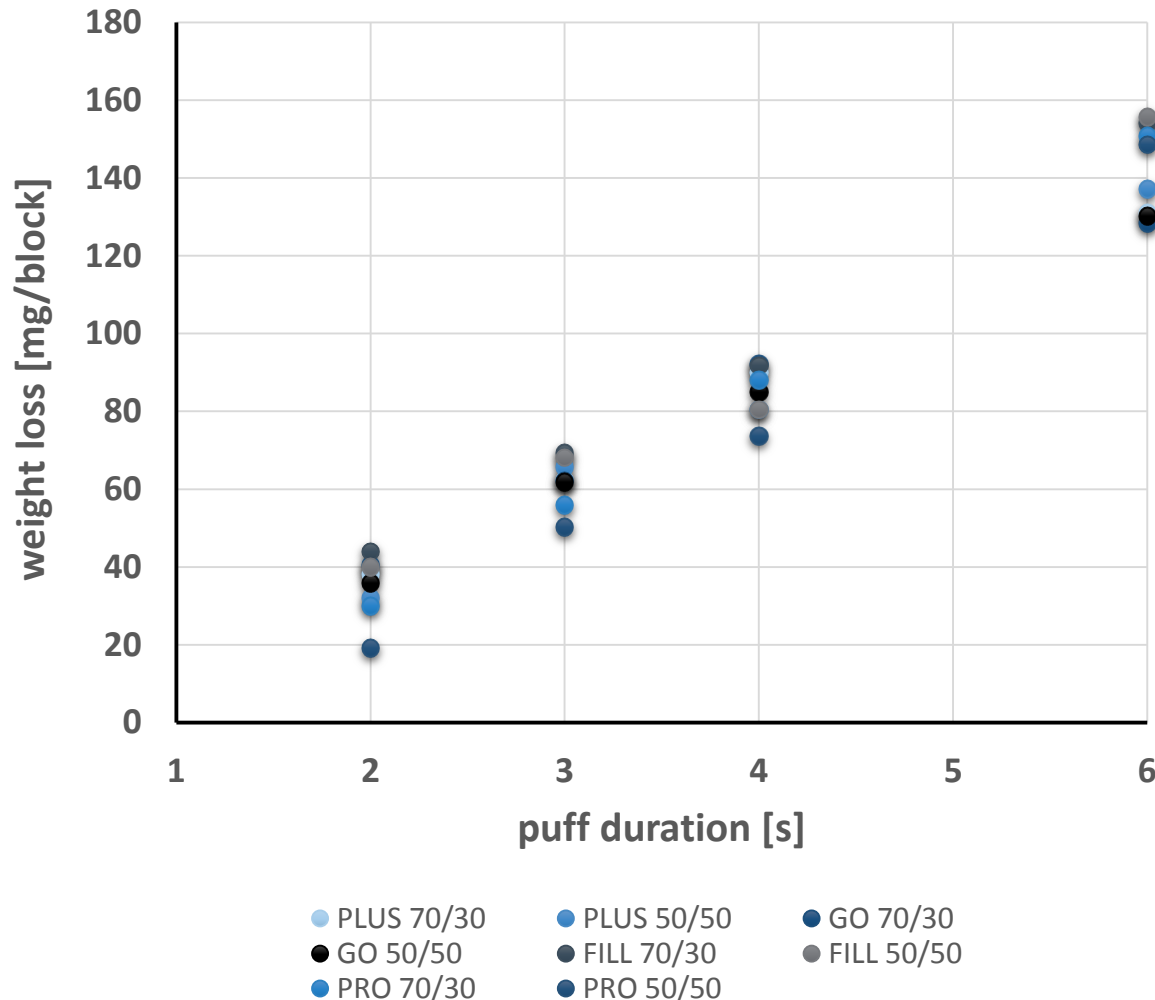

- Stability among the puff blocks for nicotine PG and VG
- base liquid composition have no significant impact on the nicotine delivery
- PG and VG yields are correlated with base liquid composition

Puff_Block

- B1
- B2
- B3
- B4
- B5

	PG (w/w)	VG (w/w)	Nicotine (w/w)
Liquid 1 (L1):	68.8 %	30 %	1.2%
Liquid 2 (L2):	48.8 %	50 %	1.2%

Impact of puff duration on weight loss

Strong and linear effect of Puff Duration on weight loss

The yields are “comparable” between devices and liquids investigated, which indicates that both base liquid composition and device design had no significant impact on the aerosol delivery in this study

Global Modelisation – Weight loss vs puff duration

Weight Loss ~ **Vaping parameters** + **Devices features** + **Liquid** + **2nd order interactions**

Puff Duration
Flow Rate
Puff Duration²
Sqrt (Puff Duration)
Log (Puff Duration)

Power
Power²
Sqrt (Power)
Log (Power)

Liquid

Power * Puff Duration
Power * Flow Rate
Power * Liquid
Puff Duration * Flow Rate
Puff Duration * Liquid
Flow Rate * Liquid

More than 26.000 combinations of models were assessed.

#Param	Vaping parameters			Devices features			Liquid	2 nd order	R ²
	Puff Duration	Flow Rate	...	Power	Power ²	...	Liquid	Puff Duration * Power	
#1	✗								89.1%
#2	✗							✗	90.0%
#3	✗						✗	✗	90.3%
#4	✗			✗	✗			✗	90.5%
...									

- ▼ 89% of the weight loss changes is explained by puff duration
- ▼ Using all significant parameters, the model has improved from 89.1% to 90.5%.

$$\text{Weight Loss} = 26.70 \times \text{Puff Duration} - 19.14 \quad (R^2 = 0.891)$$

ACM and Weight Loss Correlation

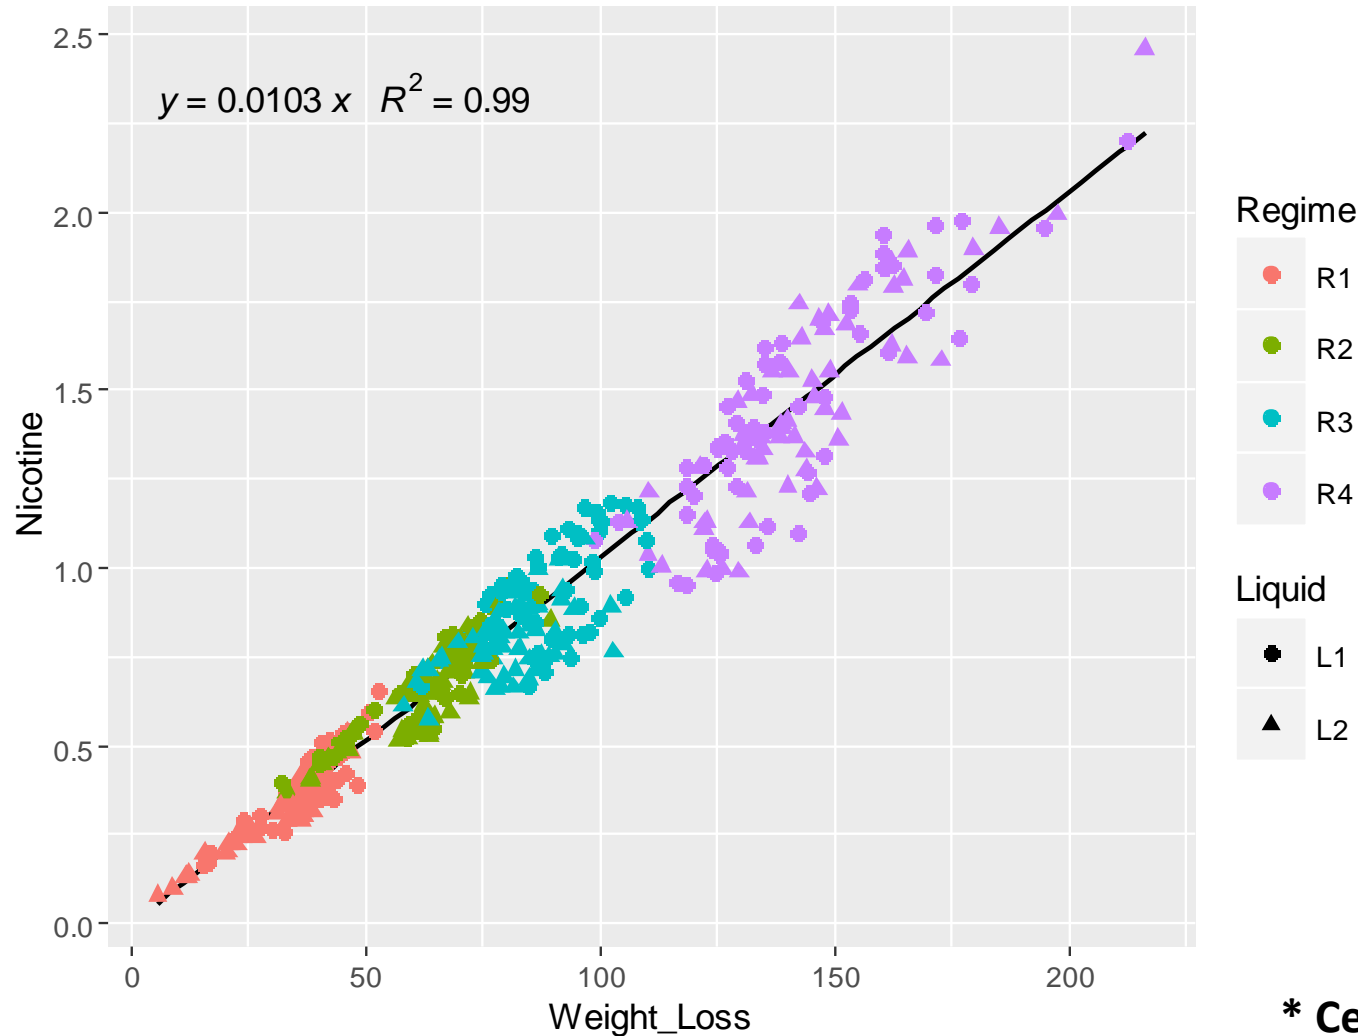

**Aerosol Collected Mass
well correlated to
Weight Loss**

**Method of trapping is efficient
whatever the devices, liquids and
vaping parameters**

Nicotine and Weight Loss Correlation

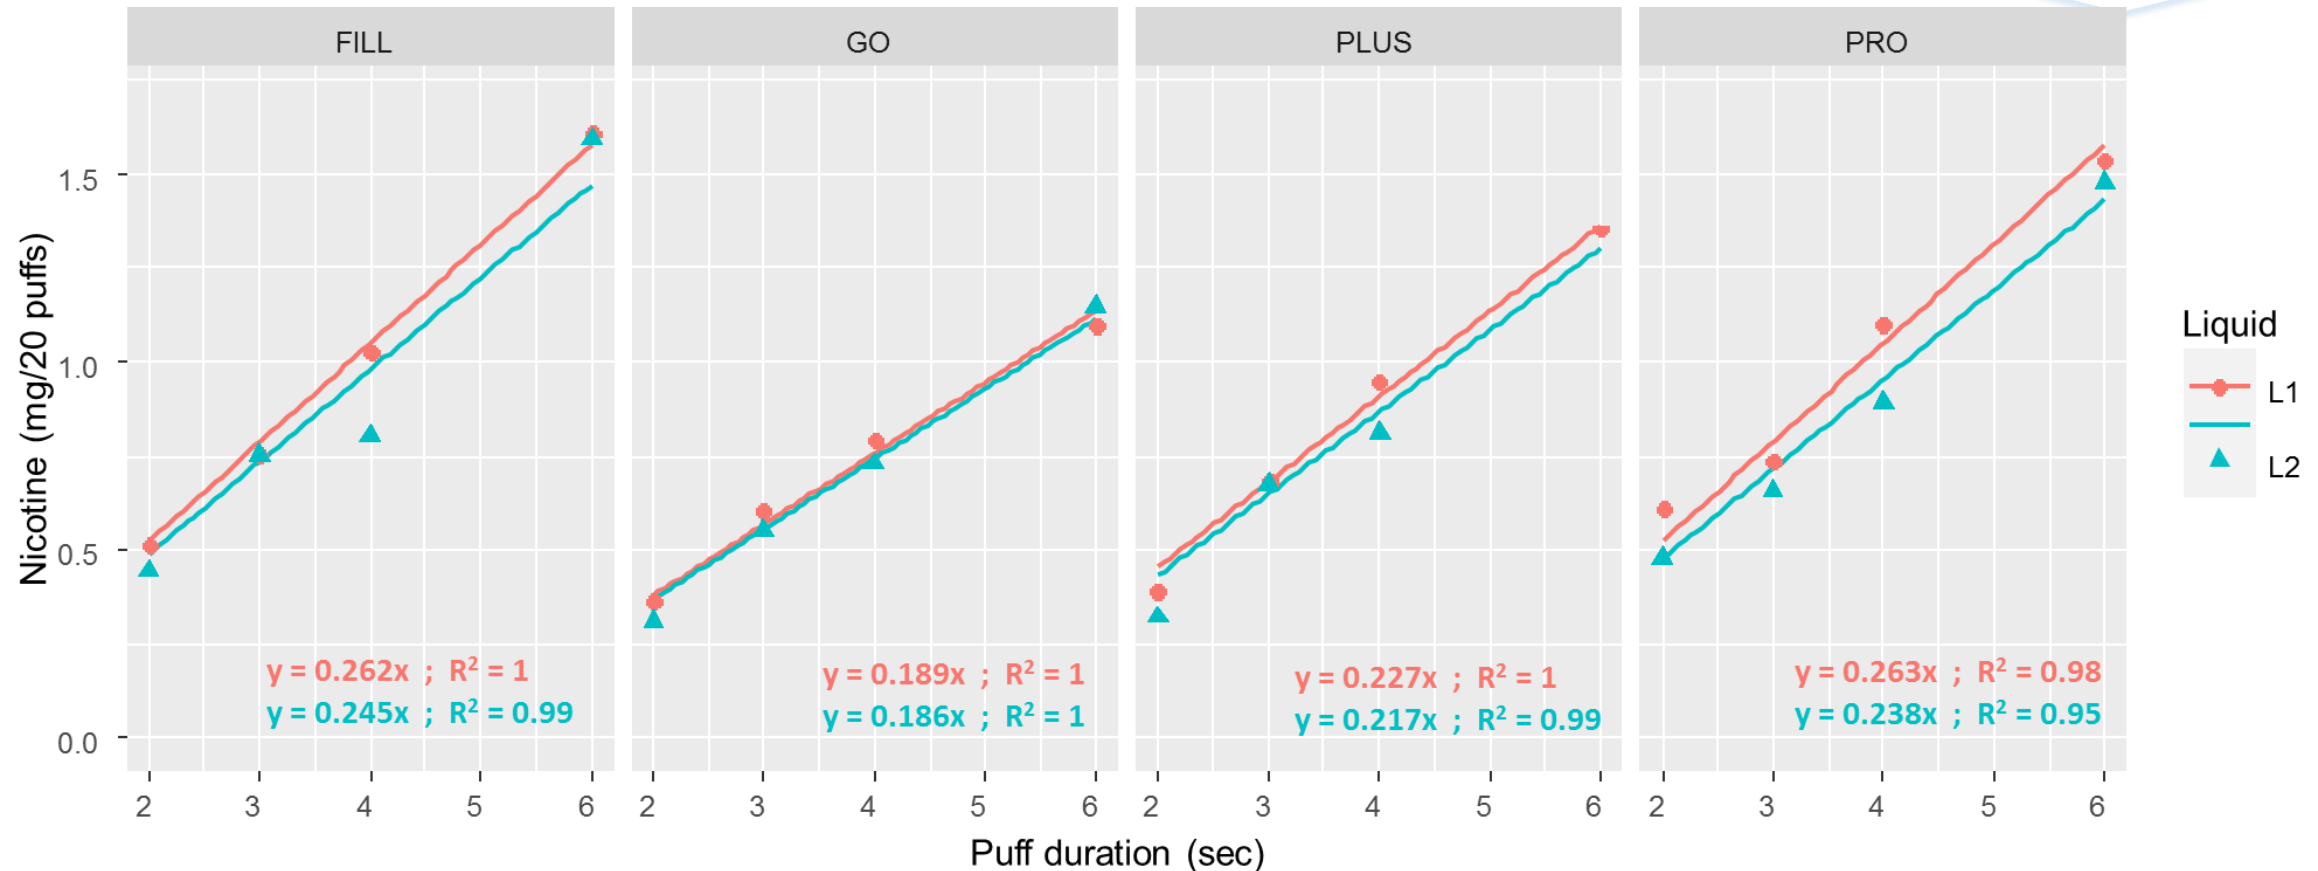

Nicotine correlated to the Weight Loss.

However global modelisation becomes difficult for nicotine due to the high variability, especially for R4

*** Certainly due the nicotine measurement**

Modelisation – nicotine vs puff duration per device/e-liquid

- Linear correlation between aerosol nicotine yield and puff duration
- Base liquid composition has no significant impact on the aerosol delivery

- The data obtained in this study showed there is a strong linear correlation between the aerosol yields and puff duration.
- Puff volume and air flow showed minor influence on aerosol yields.
- The observed correlations between puff duration and aerosol yields showed that yields changes can be explained mainly by puff duration. An increase in puff duration will increase aerosol yields in a same manner
- A single vaping regime appears to be sufficient for characterizing a product for main compounds aerosol yields
